PATHOLOGY REPORT

Clinical Information.	Mild hyperemia in the entire gastric mucosa with nodularity mostly in antrum.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 0.5 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa shows moderate infiltration by lymphocytes and plasma cells. There is evidence of inflammatory activity manifested by some neutrophils infiltrating glands. H. pylori characteristic forms are not identified. No evidence of intestinal metaplasia, atypia or malignancy.

DIAGNOSIS:

Stomach, Endoscopic biopsy:

- Moderate chronic active gastritis.
- H pylori are not identified.
- Negative for dysplasia or malignancy.
