PATHOLOGY REPORT

Clinical Information.	Gastric antral ulcer with clean base, and duodenal biopseis to rule out celiac disease.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Two biopsies were received:

- 1- Stomach: soft tissue fragments collectively measured 0.7 cm, totally embedded in one cassette.
- 2- Duodenum: soft tissue fragments collectively measured 0.7 cm, totally embedded in one cassette.

MICROSCOPIC:

Gastric mucosa showing superficial erosions with mild atrophy of glands and mild infiltration by lymphocytes and plasma cells. There is evidence of inflammatory activity manifested by neutrophils infiltrating glands. H. pylori characteristic forms are seen. No evidence of intestinal metaplasia, atypia or malignancy.

Duodenal mucosa showing mild infiltration by lymphocytes and plasma cells with follicles. Villi are intact and are negative for atrophy and ulceration. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Stomach, Endoscopic biopsy:

- H. pylori associated chronic erosive atrophic gastritis with associated moderate inflammatory activity.
- Negative for dysplasia or malignancy.

Duodenal endoscopic biopsy:

- Mild chronic non-specific inflammation.
- Negative for villous atrophy.
- Negative for malignancy.
