### PATHOLOGY REPORT

<b>Clinical Information.</b>	Chronic synovitis in a patient who underwent diagnostic and therapeutic arthroscopic debridement.
<b>Nature of specimen.</b>	Incisional biopsy.

#### GROSS:

Soft tissue fragments collectively measured 2x1.5x0.7 cm, totally embedded.

#### MICROSCOPIC:

Synovium is fibrotic and shows focal ulceration and moderate infiltration by lymphocytes, plasma cells and macrophages. There is associated capillary proliferation and mild tissue oedema. No evidence of specific granulomas. No evidence of atypia or malignancy.

#### DIAGNOSIS:

##### Synovium, incision biopsy:

- Moderate chronic non-specific synovitis.
- Negative for malignancy.
