Pt. Age:	Adult.	Gender:	Female	Received date:	2026-05-07
Referred By:	د/ أحمد البطاح		Reported date:	2026-05-12	

PATHOLOGY REPORT

Clinical Information.	Right axillary swelling.
Nature of specimen.	Incisional biopsy.

GROSS:

Partially covered soft tissue fragments collectively measured 2.8x2x0.8 cm, the largest measuring 1.5x1x0.8 cm, totally embedded.

MICROSCOPIC:

The dermis and subcutaneous fat shows lobules of breast ducts and lobules amid mature adipose tissue with dense periductal infiltration by lymphocytes, plasma cells, macrophages and neutrophils. This inflammatory infiltrate appears to destroy ductal epithelium with abscess formation. Skin is intact. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Axillary swelling, biopsy:

- Accessory breast tissue associated with duct ectasia, periductal mastitis (non-specific) and abscess formation.
- Negative for malignancy.
