PATHOLOGY REPORT

Clinical Information.	Nasopharyngeal mass.
Nature of specimen.	Nasopharyngeal biopsy.

GROSS:

Soft tissue fragments collectively measured 2.3x2x0.8 cm.

MICROSCOPIC:

An invasive undifferentiated malignant tumor formed of sheets of large rounded malignant cells exhibiting marked anaplasia and active mitosis. These sheets are separated by activated small lymphocytes. Undifferentiated carcinoma is the main possibility for such tumor. However, marker study (CD20, CD3 & CK) is needed to confirm the diagnosis and exclude the less like possibility of large cell lymphoma.

DIAGNOSIS:

- Nasopharynx, Biopsy:
- **Undifferentiated malignant large round cell tumor consistent with undifferentiated carcinoma, high grade.**
- **Recommended for confirmation of tumor type by marker study.**
