PATHOLOGY REPORT

Clinical Information.	Known case with breast abscess. Incisional biopsy from the granulation tissue.
Nature of specimen.	Incisional biopsy.

GROSS:

Two soft tissue pieces were received. The first measured 2.5x2x1.5 cm, showing a solid rubbery area of 1.5x1.5x1 cm. The second measured 2x1.7x1.5 cm, having fatty cut section. All received tissue was totally embedded.

PHOTOGRAPH

MICROSCOPIC:

There is dense periductal infiltration by lymphocytes, plasma cells, macrophages and neutrophils with some foreign-body giant cells. In many areas inflammatory infiltrate appears to destroy ductal epithelium with evidence of multiple microabscess formation. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Breast, incisional biopsy:

- Periductal granulomatous mastitis with multiple microabscesses formation.
- Negative for malignancy.
