PATHOLOGY REPORT

Clinical Information.	Diffuse edema and erythema of the stomach lining with a granular appearance.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 1.2 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa with mild glandular atrophy and mild infiltration by lymphocytes and plasma cells. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are seen colonizing glands.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori-associated chronic mild atrophic gastritis with mild inflammatory activity.
- Negative for atypia and malignancy.
