<b>Pt. Age:</b>	40 years.	<b>Gender:</b>	Male	<b>Received date:</b>	2026-01-12
<b>Referred By:</b>	د/ عبد الملك الحزورة		<b>Reported date:</b>	2026-01-16	

### PATHOLOGY REPORT

<b>Clinical Information.</b>	Laparomoy with cystectomy.
<b>Nature of specimen.</b>	Cystectomy with fluid.

#### GROSS:

One soft tissue fragment 1.5x1.2x0.8 cm.

Also received 8 ml of bloody fluid, from which 2 smears were prepared and stained.

#### PHOTOGRAPH

#### MICROSCOPIC:

Fibrotic cyst devoid of epithelial lining with wall showing dense infiltration by neutrophils, lymphocytes, plasma cells and macrophages and capillary proliferation, with scattered lymphoid follicle formation and foci of suppuration. No evidence of specific granulomas. No evidence of atypia or malignancy. Picture is consistent with chronic suppurative inflammation (abscess). Please exclude origin from related anatomic structures (perforated viscus or tubal abscess) by careful correlation with intraoperative and imaging findings. Prepared smears are hemorrhagic, showing marked inflammatory changes, free of malignant cells.

#### DIAGNOSIS:

##### Laparoscopic cystectomy and aspiration cytology :

- Chronic suppurative inflammation (abscess), negative for malignancy.
- Fluid is hemorrhagic with marked inflammatory changes, negative for malignant cells.
