<b>Pt. Age:</b>	39 years.	<b>Gender:</b>	Male	<b>Received date:</b>	2026-05-11
<b>Referred By:</b>	د/ علي إسماعيل الحوئي		<b>Reported date:</b>	2026-05-18	

### PATHOLOGY REPORT

<b>Clinical Information.</b>	History of headache and convulsion for the last few months underwent surgical resection of a major, well-defined, greyish, and firm-to-hard mass measuring approximately 5 cm located at the convex of meninges, with a provisional clinical diagnosis of meningioma.
<b>Nature of specimen.</b>	Excision biopsy

#### GROSS:

Soft tissue fragments collectively measured 8x7x2 cm, the largest measuring 3.5x3x2 cm.

#### MICROSCOPIC:

Multiple sections show cellular meningeal tumor formed of plump spindle meningeal cells with indistinct cellular borders and focally arranged in whorly patterns with many small onion-bulb structures and some psammoma bodies. No evidence of malignancy. This is a WHO grade I meningioma.

#### DIAGNOSIS:

##### Brain tumor, excision biopsy:

- Transitional meningioma, WHO grade I.
- Negative for malignancy.
