PATHOLOGY REPORT

Clinical Information.	Soft palatal parauvular lobulated mass, suspected pleomorphic adenoma. Resection with uvula was done
Nature of specimen.	Excision

GROSS:

Two soft tissue pieces measured 3x2x1.8 cm and 1x0.8x0.5 cm, totally embedded.

MICROSCOPIC:

A multinodular and partly encapsulated tumor of minor salivary gland origin, nodules are formed of myxoid stroma with stellate cells and chondroid areas. Periphery of nodules show proliferating ductal and myoepithelial cells arranged in solid groups, small trabeculae and ductal formation. No evidence of malignancy, however due to multinodularity and partial encapsulation, local recurrence may occur.

DIAGNOSIS:

Soft palatal parauvular lobulated mass, excision:

- Mixed salivary gland tumor (pleomorphic adenoma).
- Negative for malignancy.
