PATHOLOGY REPORT

Clinical Information.	Recurrent left planter swelling.
Nature of specimen.	Incisional biopsy

GROSS:

Soft tissue fragments collectively measured 1.5x1x0.7 cm, totally embedded.

MICROSCOPIC:

Intact skin with underlying non-capsulated nodular dermal tumor formed of solid masses of proliferating basaloid cells with scanty amphophilic cytoplasm. Many keratin pearls are seen denoting squamous differentiation. These masses appear to be continuous with surface epithelium. Surface is focally ulcerated by dense inflammatory cell infiltrate formed of small lymphocytes and plasma cells with neutrophils. Picture is consistent with an eccrine poroma. No evidence of malignancy.

DIAGNOSIS:

Planter swelling, incision biopsy :

- Eccrine acrospiroma (eccrine poroma), inflamed.
- Negative for malignancy.
