PATHOLOGY REPORT

Clinical Information.	Erosive sigmoiditis and erosive gastropathy.
Nature of specimen.	Gastric and colonic endoscopic biopsies.

GROSS:

Two biopsies were received:

- 1- Gastric biopsy: soft tissue fragments collectively measured 0.9 cm, totally embedded.
- 2- Colonic biopsy: soft tissue fragments collectively measured 1.2 cm, totally embedded.

MICROSCOPIC:

- Gastric mucosa showing focal superficial erosions and moderate infiltration by lymphocytes and plasma cells. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are seen colonizing glands. There is no evidence intestinal metaplasia, atypia or malignancy.
- Colonic biopsy reveals focally ulcerated colonic mucosa with mild reduction in the number of mucigenic cells and moderate infiltration by lymphocytes, plasma cells and neutrophils. However, crypt abscesses are not identified. No evidence of atypical or malignant cells.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori-associated chronic erosive follicular gastritis with moderate inflammatory activity.
- Negative for intestinal metaplasia.
- Negative for dysplasia.
- Negative for malignancy.

Sigmoid, endoscopic biopsy:

- Moderate chronic colitis with inflammatory activity and focal superficial erosions.
- Negative for malignancy.
