PATHOLOGY REPORT

Clinical Information.	?A parotid mass with cystic features, present for 10 years, presenting without associated pain, without lymphadenopathy, and with a normal facial nerve, highly suggestive of a pleomorphic adenoma or a mucoepidermoid carcinoma.
Nature of specimen.	Excision biopsy

GROSS:

Soft tissue mass measuring 4.5x3x2.8 cm.

MICROSCOPIC:

A multinodular and partly encapsulated tumor of parotid gland, nodules are formed of myxoid stroma with stellate cells and chondroid areas. Periphery of nodules show proliferating ductal and myoepithelial cells arranged in solid groups, small trabeculae and ductal formation. No evidence of malignancy.

DIAGNOSIS:

Parotid gland mass, Superficial parotidectomy:

- Mixed salivary gland tumor (pleomorphic adenoma).
- Negative for malignancy.
