PATHOLOGY REPORT

Clinical Information.	Perianal fistula, suspected tuberculosis.
Nature of specimen.	Excision

GROSS:

Partially covered soft tissue fragment measured 1 x0.8 x0.6 cm, totally embedded.

MICROSCOPIC:

Submitted material is fragmented showing extensively ulcerated surface mucosa with related dense infiltration by neutrophils, lymphocytes, plasma cells, macrophages and few multinucleated foreign body type giant cells. Picture is consistent with chronic suppurative inflammation complicating an underlying perianal fistula. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Perianal tissue, fistulectomy:

- Chronic suppurative inflammation (abscess) complicating an underlying perianal fistula.
- Negative for specific granuloma.
- Negative for atypia and malignancy.
