PATHOLOGY REPORT

Clinical Information.	Para-appendicular cyst.
Nature of specimen.	Appendectomy

GROSS:

Appendix measuring 5.5x1 cm and attached mesoappendiceal fat measuring 3.5x1 cm, showing ulcerated greyish appearance with wall thickness of 0.4 cm.

MICROSCOPIC:

Appendicular lumen is full of neutrophils that extend into wall in between the mucosal associated lymphoid tissue together with lymphocytes and plasma cells. Wall appears disrupted and completely replaced by this inflammatory infiltrated in wide areas. This inflammatory infiltrate extends to peri-appendicular soft tissue with abscess formation. No evidence of specific granulomas. No evidence of appendicular tumors.

DIAGNOSIS:

Appendix, appendectomy:

- Acute (suppurative) appendicitis with and periappendicitis and abscess formation.
- Negative for tumors.
