Referred By:	أ.د/ توفيق المخلافي		Reported date:	2026-06-09	

PATHOLOGY REPORT

Clinical Information.	Recurrent perianal fistula.
Nature of specimen.	Fisulectomy.

GROSS:

Fibrotic fragment measures 8x6x4 mm.

MICROSCOPIC:

Submitted material is fragmented showing ulcerated surface mucosa with related dense infiltration by neutrophils, lymphocytes, plasma cells and, macrophages. Picture is consistent with chronic suppurative inflammation complicating an underlying perianal fistula. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Perianal lesion, Excision:

- Chronic suppurative inflammation (abscess) complicating an underlying perianal fistula.
- Negative for malignancy.
