PATHOLOGY REPORT

Clinical Information.	Known case of crohns disease. Colonoscopy revealed edematous erythematous mucosa with linear aphthous ulcers in rectum and sigmoid.
Nature of specimen.	Endoscopic biopsy.

GROSS:

Soft tissue fragments collectively measured 0.9 cm.

MICROSCOPIC:

Colonic mucosa shows patchy chronic inflammation with focal surface erosion, lamina propria expanded by lymphoplasmacytic infiltrates and lymphoid aggregates, and scattered poorly-formed non-caseating granulomas away from the crypts; crypt architecture is preserved and no crypt abscesses are identified.

DIAGNOSIS:

Colonoscopic biopsy:

- Crohn's disease, active.
- Negative for dysplasia.
