## PATHOLOGY REPORT

|                       |   |
|-----------------------|---|
| Clinical Information. | Left leg biopsy: History of prior trauma and a suspected recurrent acute-on-chronic osteomyelitis of the tibia, presenting with a thick-septated, peripherally enhancing intramedullary and periosteal collection associated with cortical sclerosis, a sequestrum, a cloaca, and an active sinus tract extending through the adjacent soft tissue to the skin. |
| Nature of specimen.   | Biopsy  |

### GROSS:

Soft tissue and bone fragments collectively measured 6x5x1 cm, totally embedded.

### MICROSCOPIC:

Submitted soft tissues and bony fragments show dense infiltration by neutrophils, lymphocytes, plasma cells, and macrophages with related capillary proliferation. No evidence of specific granulomas. No evidence of malignancy.

### DIAGNOSIS:

#### Left leg biopsy;

- Chronic suppurative osteomyelitis extending to surrounding soft tissues.
- Negative for malignancy.
