PATHOLOGY REPORT

Clinical Information.	Epigastric pain and heartburn. Endoscopy: GERD grade C with esiphagitis? Eosinophilic esiphagitis.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Two biopsies were received:

- 1- Esophageal papules: soft tissue is measured 0.5 cm, totally embedded.
- 2- Esophageal mucoss: soft tissue fragments collectively measured 1 cm, totally embedded.

MICROSCOPIC:

Both biopsies show Superficial biopsy material with intact hyperplastic stratified squamous epithelium. No evidence of intestinal or gastric metaplasia. No evidence of eosinophilic esophagitis. One fragment in the second biopsy shows lamina propria involved by moderate chronic non specific inflammatory infiltrate. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

(1) & (2) Esophagus, endoscopic biopsies:

- Superficial material, intact hyperplastic esophageal squamous epithelium with moderate chronic non-specific esophagitis, consistent with GERD.
- Negative for eosinophilic esophagitis.
- Negative for malignancy.
