PATHOLOGY REPORT

|                       |                     |
|-----------------------|---------------------|
| Clinical Information. | Facial skin lesion. |
| Nature of specimen.   | Excision            |

GROSS:

Skin ellipse measured 5x2.5x1 cm, showing ulcerative mass measuring 3.5x2.3x0.9 cm. No evidence of surrounding tissue clear margin.

MICROSCOPIC:

Sections examined ulcerated skin with related invasive carcinoma formed of solid groups of moderately keratinized squamous cells exhibiting moderate anaplasia and mitosis. Infiltration extends to involve the whole dermis and reaching very close to subcutaneous fat. No evidence of lymphovascular or perineural invasion. No evidence of surrounding tissue clearance.

DIAGNOSIS:

Facial skin lesion, excision:

- Squamous cell carcinoma, grade 2.
