PATHOLOGY REPORT

Clinical Information.	Bulky uterus.
Nature of specimen.	Total abdominal hysterectomy with bilateral salpingectomy and right oophorectomy

GROSS:

Total abdominal hysterectomy with bilateral salpingectomy and right oophorectomy: specimen: uterus measuring 9 x 7 x 5 cm, upon sectioning, revealed a myometrium measuring 2.5 cm in thickness. The endometrium measured 0.5 cm in thickness, and the cervix measured 3 cm in length. The right ovary measured 3 x 1.5 x 2 cm and exhibited a cyst measuring 1.5 x 1 cm. The right and left fallopian tubes measured 5 x 0.5 cm and 7 x 0.5 cm, respectively.

MICROSCOPIC:

Endometrium is non-secretory, it is formed of slightly branching glands lined by 1-3 layers of cells. Stroma is cellular. No evidence of complex glandular pattern. Some of these hyperplastic glands are seen embedded within deep myometrium. Rt. ovary shows hemorrhagic luteal cyst. Cervix and Fallopian tubes are unremarkable. No evidence of atypia or malignancy.

DIAGNOSIS:

Total abdominal hysterectomy with bilateral salpingectomy and right oophorectomy:

- Moderate simple endometrial hyperplasia.
- Deep adenomyosis
- Rt.ovarian hemorrhagic luteal cyst.
- Unremarkable cervix and Fallopian tubes.
- Negative for atypia and malignancy.
