PATHOLOGY REPORT

Clinical Information.	Inflammatory breast mass with chronic abscess.
Nature of specimen.	Biopsy

GROSS:

Fatty soft tissue measured 2x1.5x1 cm, totally embedded.

MICROSCOPIC:

Submitted mature adipose tissue with evidence of focal fat necrosis together with related infiltration by foamy histiocytes, plasma cells and lymphocytes. No evidence of breast parenchymatous tissue. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Breast mass, biopsy:

- Mature adipose tissue with areas of fat necrosis.
- Negative for malignancy.
