PATHOLOGY REPORT

Clinical Information.	Normal endoscopic picture of terminal ileum with small cecal ulcer.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Two biopsies were received:

- 1- Terminal ileum: soft tissue fragments collectively measured 1 cm, totally embedded.
- 2- Cecum: soft tissue fragments collectively measured 1 cm, totally embedded.

MICROSCOPIC:

- Ileal mucosa showing mild infiltration by lymphocytes and plasma cells. Villi are intact and are negative for atrophy and ulceration. No evidence of specific granulomas. No evidence of malignancy.
- Submitted material shows cecal mucosa moderately infiltrated by lymphocytes, plasma cells and few neutrophils. Mucigenic cells are intact and no evidence of crypt abscesses. One fragment shows extensive ulceration with related active inflammatory reaction rich in neutrophils with endothelial proliferation. No evidence of malignancy.

DIAGNOSIS:

Terminal ileum, endoscopic biopsies:

- Mild chronic non-specific inflammation.
- Negative for villous atrophy.
- Negative for malignancy.

Cecum, endoscopic biopsy:

- Moderate chronic non-specific colitis with associated active ulceration.
- Negative for malignancy.
