PATHOLOGY REPORT

Clinical Information.	Small lymphoid likely follicles scattered all over the colon, with small sessile polyp at 60 cm from anal verge.
Nature of specimen.	Endoscopic biopsies

GROSS:

Fragments of collective size 7x6 mm.

MICROSCOPIC:

Intact colonic mucosa mildly infiltrated by lymphocytes and plasma cells with lymphoid follicles. Mucigenic cells are intact. Some neutrophils are seen infiltrating glands but there is no evidence of crypt abscesses. No evidence of atypia or malignancy.

Polypoid lesion formed of hyperplastic intact colonic glands with preserved mucigenic activity. Stroma is fibrotic and shows mild chronic inflammatory reaction composed of lymphocytes and plasma cells. No evidence of specific granulomas. No evidence of crypt abscesses. No evidence of atypia or malignancy.

DIAGNOSIS:

Colon, endoscopic biopsy and polypectomy:

- Mild follicular colitis with minimal inflammatory activity.
- Hyperplastic polyp, inflamed.
- Negative for dysplasia and malignancy.
