PATHOLOGY REPORT	
Clinical Information.	Gastric nodularity with duodenal flat folds.
Nature of specimen.	Endoscopic biopsy

GROSS:

Two biopsies were received:
1- Gastric: soft tissue fragments collectively measured 0.5 cm, totally embedded.
2- Duodenal: soft tissue fragments collectively measured 0.5 cm, totally embedded.

MICROSCOPIC:

- Gastric mucosa showing moderate glandular atrophy and moderate to marked infiltration by lymphocytes and plasma cells. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy.
- Duodenal mucosa with focal surface erosion showing moderate infiltration by lymphocytes and plasma cells with few neutrophils indicating activity. Villi are intact and are negative for atrophy. No evidence of specific granulomas. No evidence of malignancy

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori-associated chronic atrophic gastritis with moderate inflammatory activity.
- Negative for atypia and malignancy.

Duodenum, endoscopic biopsy:

- Moderate chronic non-specific duodenitis with minimal inflammatory activity and superficial erosion.
- Negative for atypia and malignancy.
- Negative for villus atrophy.
