

Pt. Name:	وزيرة حمدان حسن عزان			Lab Number:	4286-2026
Pt. Age:	25 years.	Gender:	Female	Received date:	2026-06-22
Referred By:	د/ سميرة التويتي			Reported date:	2026-06-26

PATHOLOGY REPORT

Clinical Information.	Lower abdominal pain and found on imaging to have a multilocular, multiseptated right ovarian cyst with thick internal contents (highly suspicious for an endometriotic or complicated cyst) along with a left corpus luteum cyst.
Nature of specimen.	Bilateral ovarian cystectomy

GROSS:

Three intact cysts collectively measured 6.5x5.5x3 cm, the largest measuring 4x3.5x3 cm, filled with gelatinous material.

MICROSCOPIC:

One cyst show a benign paratubal cyst lined by a single layer of ciliated Müllerian-type epithelium resting on a vascularized fibromuscular wall, consistent with a hydatid cyst of Morgagni. No evidence of atypia or malignancy.

Another cyst shows fibrotic cyst wall lined by a single layer of cuboidal non-mucigenic cells. No evidence of epithelial piling up or cytological atypia. Fallopian tube is unremarkable. No evidence of atypia or malignancy.

Other cyst is lined by several layers of polygonal luteinized cells with interstitial hemorrhage into wall. No evidence of atypia or malignancy.

DIAGNOSIS:

Bilateral ovarian cystectomy:

- Inclusion cyst of Morgagni.
- Ovarian simple serous cyst.
- Hemorrhagic luteal cyst.
- Negative for endometriosis.
- Negative for malignancy.
