PATHOLOGY REPORT

Clinical Information.	Prececal polypoidal lesion.
Nature of specimen.	Endoscopic biopsy

GROSS:

Two biopsies were received:

- 1- Colon: soft tissue fragments collectively measured 0.7 cm, totally embedded.
- 2- Polyp: soft tissue fragments collectively measured 0.4 cm, totally embedded.

MICROSCOPIC:

- Intact colonic mucosa mildly infiltrated by lymphocytes and plasma cells. Mucigenic cells are intact. Some neutrophils are seen infiltrating glands but there is no evidence of crypt abscesses. No evidence of atypia or malignancy.
- Polypoid lesion formed of hyperplastic intact colonic glands with preserved mucigenic activity. Stroma is fibrotic and shows moderate chronic inflammatory reaction composed of lymphocytes and plasma cells amounting at lymphoid follicle formation. No evidence of specific granulomas. No evidence of crypt abscesses. No evidence of atypia or malignancy.

DIAGNOSIS:

Colon, endoscopic biopsy:

- Mild chronic non specific colitis with minimal inflammatory activity.
- Negative for dysplasia and malignancy.

Cecum, endoscopic polypectomy

- Hyperplastic polyp, inflamed.
- Negative for malignancy.
