PATHOLOGY REPORT

Clinical Information.	Lt. arm soft tissue mass.
Nature of specimen.	Biopsy

GROSS:

Soft tissue mass measured 5x3x2.3 cm.

MICROSCOPIC:

Sections show a benign, unencapsulated lesion characterized by an intimate admixture of vascular, adipose, and skeletal muscle elements. Prominent, irregularly dilated vascular channels lined by a single layer of bland endothelial cells dissect through the deep soft tissue. These vascular spaces are filled with erythrocytes and are associated with focal hemorrhage and congestion. Abundant mature adipose tissue infiltrates and separates the native skeletal muscle fascicles, with focal entrapment of skeletal muscle fibers. No evidence of specific granulomas. No evidence of atypia or malignancy.

DIAGNOSIS:

Left arm mass, biopsy:

- Intramuscular venous malformation.
- Negative for malignancy.
