PATHOLOGY REPORT	
Clinical Information.	Erosive colonic ulceration with marked edema.
Nature of specimen.	Endoscopic biopsy

GROSS:

Soft tissue fragments collectively measured 1.2 cm, totally embedded.

MICROSCOPIC:

Submitted biopsy showing partially ulcerated mucosal fragments with related septic granulation tissue formed of proliferating capillaries separated by edematous stroma densely infiltrated by lymphocytes, histiocytes, plasma cells and many neutrophils. Rest of fragments feature intact colonic mucosa with mild reduction in the number of mucigenic cells and moderate infiltration by lymphocytes, plasma cells and neutrophils. However, crypt abscesses are not identified. No evidence of atypical or malignant cells.

DIAGNOSIS:

Colon, endoscopic biopsies:

- Active inflammatory ulceration (Septic granulation tissue) with moderate chronic colitis and inflammatory activity.
- Negative for atypia or malignancy.
