<b>Pt. Age:</b>	52 years.	<b>Gender:</b>	Male	<b>Received date:</b>	2026-01-18
<b>Referred By:</b>	د/ مؤيد عبد الغفار		<b>Reported date:</b>	2026-01-22	

## PATHOLOGY REPORT

<b>Clinical Information.</b>	Scalp mass
<b>Nature of specimen.</b>	Excision biopsy

### GROSS:

Soft tissue fragments collectively measured 3.9x2.8x cm, with the largest measuring 3.1x1.8x1 cm and covered by skin, totally embedded.

### MICROSCOPIC:

A cellular non-capsulated tumor showing stipiform pattern of proliferating fibroblasts and histiocyte-like cells. Anaplasia is mild and mitotic activity is increased. All margins in the submitted fragments are reached by tumor. Confirmatory marker study is recommended (CD34).

### DIAGNOSIS:

#### Scalp lesion, excision:

- Dermatofibrosarcoma, low grade.
- Recommended for confirmatory marker study.
- Margins of excision are infiltrated by tumor.

### COMMENT:

This tumor is of low malignant potential but due to absence of surrounding tissue clearance, local recurrence is a very likely possibility, hence wider excision of tumor bed is recommended.
