PATHOLOGY REPORT

Clinical Information.	Sublingual salivary gland lesion.
Nature of specimen.	Excision

GROSS:

Soft tissue piece measuring 2.5 x 1 x 0.7 cm, totally embedded.

MICROSCOPIC:

Sections show salivary gland tissue with preserved lobular architecture. The interstitium is expanded by a dense chronic inflammatory infiltrate composed predominantly of lymphocytes and plasma cells, with conspicuous periductal accentuation and focal lymphoid aggregate formation. The ducts exhibit mild ectasia with focal reactive epithelial hyperplasia. Associated focal acinar atrophy and mild interstitial fibrosis are present. No evidence of specific granulomas. No evidence of atypia or malignancy.

DIAGNOSIS:

Sublingual Salivary Gland, Excision:

- Chronic non-specific sialadenitis.
- Negative for malignancy.
