PATHOLOGY REPORT

Clinical Information.	Gastric fundal ulcers with hyperemic friable mucosa. History of melanoma with liver metastasis.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Soft tissue fragments collectively measured 0.5 cm, totally embedded.

MICROSCOPIC:

One of submitted fragment show atypical round cell infiltrate, showing hyperchromatic nuclei and modest eosinophilic cytoplasm. Anaplasia is marked and mitosis is active. These cells are seen related to extensive surface ulceration with granulation tissue formation. Rest of fragments show mild infiltration by lymphocytes and plasma cells. Some neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are not seen. Marker study is recommended to delineate the nature of these cells (CK, LCA and CD20) is recommended for definitive typing.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- Mild chronic active gastritis with suspicious atypical round cell infiltrate.
- Recommended for typing by marker study.
