PATHOLOGY REPORT

Clinical Information.	Chronic active gastritis with bile reflux.
Nature of specimen.	Endoscopic biopsies.

GROSS:

Two biopsies were received:

- 1- Gastric: soft tissue fragments collectively measured 0.6 cm, totally embedded.
- 2- Colonic: soft tissue fragments collectively measured 0.5 cm, totally embedded.

MICROSCOPIC:

- Gastric mucosa antral type showing moderate atrophy of glands and moderate infiltration by lymphocytes and plasma cells. There is evidence of focal inflammatory activity manifested by few neutrophils infiltrating glands, however H. pylori characteristic forms are not seen. No evidence of intestinal metaplasia, atypia or malignancy.
- Intact colonic mucosa mildly infiltrated by lymphocytes and plasma cells with lymphoid follicles. Mucigenic cells are intact. Some neutrophils are seen infiltrating glands but there is no evidence of crypt abscesses. No evidence of atypia or malignancy.

DIAGNOSIS:

Stomach, Endoscopic biopsy:

- Moderate chronic atrophic gastritis with associated mild inflammatory activity.
- H. pylori are not identified.
- Negative for dysplasia or malignancy.

Colon, endoscopic biopsy:

- Mild follicular colitis with minimal inflammatory activity.
- Negative for dysplasia and malignancy.
