PATHOLOGY REPORT

Clinical Information.	Lt. sided colitis (biopsed) with gastric biopsy to rule out H pylori.
Nature of specimen.	Endoscopic biopsy

GROSS:

Two biopsies were received:

- 1- Gastric: soft tissue fragments collectively measured 0.6 cm, totally embedded.
- 2- Colonic: soft tissue fragments collectively measured 0.9 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa showing mild glandular atrophy with moderate infiltration by lymphocytes and plasma cells. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are present. There is no evidence of intestinal metaplasia, atypia or malignancy.

Intact colonic mucosa mildly infiltrated by lymphocytes and plasma cells. Mucigenic cells are intact. Some neutrophils are seen infiltrating glands but there is no evidence of crypt abscesses. No evidence of atypia or malignancy.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori associated chronic atrophic gastritis with mild inflammatory activity.
- Negative for intestinal metaplasia, dysplasia or malignancy

Colon, endoscopic biopsy:

- Mild chronic non specific colitis with minimal inflammatory activity.
- Negative for dysplasia and malignancy.
