PATHOLOGY REPORT

Clinical Information.	Severe antral gastritis.
Nature of specimen.	Endoscopic biopsy.

GROSS:

Soft tissue fragments collectively measured 0.6 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa body type showing moderate atrophy of glands and mild infiltration by lymphocytes and plasma cells. Lymphocytes aggregate in some foci to form lymphoid follicles. Neutrophils are seen infiltrating glands thus indicating activity. *H. pylori* characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy. Since cytotoxin-producing *H. pylori* are capable of inducing complications, their serological detection is recommended.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- *H. pylori*-associated chronic follicular gastritis with moderate glandular atrophy and moderate inflammatory activity.
- Negative for malignancy.
