PATHOLOGY REPORT

Clinical Information.	Lapaeotomy for acute abdomen. History of TB.
Nature of specimen.	Segmental resection

GROSS:

Small intestinal segment measured 18 cm long with attached mesentery, showing perforated wall in an area of 1.8 cm. Careful inspection did not reveal any gross masses or ulcerations. Multiple lymph nodes were dissected largest is 0.4 cm.

MICROSCOPIC:

Sections from the perforated area show ulceration of small intestinal mucosa with related transmural infiltration by lymphocytes, plasma cells, macrophages, and neutrophils reaching to the serosal covering, with related vascular congestion. Resection margins are viable but inflamed. Lymph node show chronic non specific lymphadenitis, free of metastases 0/9. No evidence of specific granulomas. No evidence of malignancy.

DIAGNOSIS:

Small intestinal perforation, segmental resection:

- Inflammatory perforation with related peritonitis.
- Negative for specific granulomas.
- Negative for malignancy.
