PATHOLOGY REPORT

Clinical Information.	Panerythema of gastric mucosa.
Nature of specimen.	Endoscopic biopsy.

GROSS:

Soft tissue fragments collectively measuring 0.9 x 0.9 x 0.7 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa showing moderate infiltration by lymphocytes and plasma cells. Lymphocytes aggregate in some foci forming lymphoid follicles. Neutrophils are seen infiltrating glands thus indicating activity. *H. pylori* characteristic forms are seen colonizing glands. Areas of intestinal metaplasia are noted., No evidence of atypia or malignancy. Since cytotoxin-producing *H. pylori* are capable of inducing complications, their serological detection is recommended.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- ***H. pylori*-associated moderate chronic follicular gastritis with moderate inflammatory activity and associated intestinal metaplasia.**
- **Negative for atypia or malignancy.**
