PATHOLOGY REPORT

Clinical Information.	Pangastric erythema with erosion.
Nature of specimen.	Endoscopic biopsy.

GROSS:

Soft tissue fragments collectively measured 0.6 cm, totally embedded.

MICROSCOPIC:

Focally ulcerated gastric mucosal fragments showing moderate infiltration by lymphocytes and plasma cells. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are seen colonizing glands. No evidence of atypia, intestinal metaplasia or malignancy. Since cytotoxin-producing H. pylori are capable of inducing complications, their serological detection is recommended.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori-associated moderate chronic gastritis with moderate inflammatory activity with focal superficial erosions.
- Negative for atypia, intestinal metaplasia and malignancy.
