PATHOLOGY REPORT

Clinical Information.	Gastric ulcer
Nature of specimen.	Endoscopic biopsy.

GROSS:

Soft tissue fragments collectively measured 1 cm, totally embedded.

MICROSCOPIC:

Focally ulcerated gastric mucosal fragments showing mild atrophy of glands and moderate infiltration by lymphocytes and plasma cells. Some neutrophils are seen infiltrating glands thus indicating activity. *H. pylori* characteristic forms are seen colonizing glands. Areas of intestinal metaplasia are seen. Focal mild reparative dysplastic changes are noted. No evidence of malignancy.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- *H. pylori*-associated chronic atrophic gastritis with moderate activity and areas of intestinal metaplasia and focal mild reparative dysplasia.
- No evidence of frank malignancy.

COMMENT

Repeat endoscopy with rebiopsy following treatment of inflammation is recommended to confirm resolution of dysplastic changes after the inflammatory process has subsided.
