PATHOLOGY REPORT

Clinical Information.	Hyperemic nodular gastric mucosa.
Nature of specimen.	Endoscopic biopsy.

GROSS:

Soft tissue fragments collectively measured 0.6 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa showing mild atrophy of glands with moderate infiltration by lymphocytes and plasma cells. Lymphocytes aggregate in some foci forming lymphoid follicles. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are seen colonizing glands. No evidence of intestinal metaplasia, atypia or malignancy. Since cytotoxin-producing H. pylori are capable of inducing complications, their serological detection is recommended.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori-associated moderate chronic follicular gastritis with moderate inflammatory activity.
- Negative for intestinal metaplasia, atypia or malignancy.
