Pt. Age:	55 years.	Gender:	Male
Received date:		Reported date:	2026-01-30
Referred By:	د/ محمد الحميدي		

PATHOLOGY REPORT

Clinical Information.	Large polypoidal lesion 35 cm from central incisors.
Nature of specimen.	Endoscopic biopsy.

GROSS:

Soft tissue fragments collectively measured 1.2 cm, totally embedded.

MICROSCOPIC:

Gastroesophageal junction biopsy is dominantly showing inflamed gastric mucosa body type with other fragments showing completely necrotic with ghosts of rounded cells. These cells are suspicious of necrotic tumor. Another larger and deeper biopsy taken from sites away from the necrotic center of the esophageal mass is recommended to establish definitive diagnosis.

DIAGNOSIS:

Distal esophageal mass, endoscopic biopsy:

- Completely necrotic tumor.
- Recommended for re-biopsy from the mass.
