Pt. Age:	14 years.	Gender:	Female	Received date:	2026-01-28
Referred By:	د/ بلال الجدسي		Reported date:	2026-02-01	

PATHOLOGY REPORT

Clinical Information.	Middle finger swelling.
Nature of specimen.	Excision biopsy

GROSS:

Soft tissue fragment measured 1.8x1.5x0.9 cm, totally embedded.

MICROSCOPIC:

A benign lesion composed of proliferating fibroblasts, histiocytic cells (some are hemosiderin-laden) and multinucleated giant cells of the osteoclastic type. There are scattered lymphocytes. This is the so called localized tenosynovitis. No evidence of malignancy.

DIAGNOSIS:

Middle finger swelling, excision biopsy:

- Giant cell tumor of tendon sheath (Localized tenosynovitis).
- Negative for malignancy.
