PATHOLOGY REPORT

Clinical Information.	Neck lymphadenopathy. neck CT scan: multiple lymphadenopathies in the right upper, mid and lower deep jugular variable sized, the most of them with central necrosis, the largest measuring about 18 x 19 x 20 mm.
Nature of specimen.	Excision biopsy.

GROSS:

One lymph node measuring 2 x 1.5 x 1 cm shows a white cut surface with a necrotic area and was totally embedded.

MICROSCOPIC:

Lymph node shows caseating granulomas rich in epithelioid cells & Langhans giant cells. Picture is consistent with a tuberculous etiology. No evidence of malignancy.

DIAGNOSIS:

Cervical lymph node excision biopsy:

- Caseating granulomatous lymphadenitis (Tuberculosis).
- Negative for malignancy.

COMMENT:

Confirmatory microbiological studies and skin testing are recommended for confirmation of etiology
