PATHOLOGY REPORT

Clinical Information.	Uterine masses.
Nature of specimen.	Excision biopsy

GROSS:

Fibroid masses collectively measured 7x6.5x2.3 cm, with the largest measuring 4x3x2.3 cm, having solid rubber whitish cut section.

MICROSCOPIC:

Moderately cellular myometrial tumors formed of whorly bundles of mature smooth muscles separated by a fibrous stroma. Few mitotic figures are observed. One of them showed giant bizzare nuclei. There is no evidence of tumor necrosis, atypia or malignancy.

DIAGNOSIS:

Uterine masses, excision

- Cellular leiomyomas with one leiomyoma with bizzare nuclei (symblastic leiomyoma)
- Negative for malignancy.
- Recommended for follow-up.

COMMENT:

The majority of cellular leiomyomas will behave in a benign fashion. However, some will show a more aggressive behavior; hence, a long-term follow-up policy is advised.
