## PATHOLOGY REPORT

Clinical Information.	Uterine prolapse.
Nature of specimen.	Vaginal hysterectomy.

### GROSS:

Hysterectomy showing uterus measured 10.5x6.5x4.8 cm, with myometrium measuring 2.4 cm and endometrium measured 0.5 cm, with intramural fibroid mass measuring 1.7x1.3x1 cm. Cervix measured 3.5 cm.

### MICROSCOPIC:

Endometrium is non-secretory and hyperplastic, it is formed of branching glands exhibiting focal moderate crowding and lined by 1-3 layers of cells. Glands show focal complexity of their contour. Stroma is cellular. No evidence of atypia or malignancy. Some of these hyperplastic glands are seen embedded within superficial myometrium. Myometrial tumor is a benign leiomyoma formed of whorly bundles of mature smooth muscles separated by a fibrous stroma. No evidence of tumor necrosis. No evidence of atypia or malignancy. Cervix shows Nabothian cysts and mild endocervicitis.

### DIAGNOSIS:

#### Hysterectomy:

- Moderate adenomatous endometrium hyperplasia.
- Superficial adenomyosis.
- Leiomyoma
- Cervical Nabothian cysts and mild endocervicitis
- Negative for atypia or malignancy.
