PATHOLOGY REPORT

Clinical Information.	Fibrous tissue in the anterior part of the tongue.
Nature of specimen.	Excision biopsy.

GROSS:

Soft tissue piece measuring 0.7 x 0.6 x 0.5 cm; totally embedded.

MICROSCOPIC:

Benign polypoid lesion covered by keratinizing stratified squamous epithelium displaying hyperkeratosis and parakeratosis. Core is fibrotic and vascular. No evidence of specific granulomas. No evidence of atypia or malignancy. Follow-up is recommended.

DIAGNOSIS:

Tongue lesion, Excision Biopsy:

- Fibroepithelial polyp with hyperkeratosis.
- Negative for atypia or malignancy.
- Recommended for follow up.
