Pt. Age:	52 years.	Gender:	Male
Received date:		Reported date:	2026-02-04
Referred By:	د/ عقيل الشامي		

PATHOLOGY REPORT

Clinical Information.	Rectal mass.
Nature of specimen.	Colonoscopic biopsy.

GROSS:

Soft tissue fragments collectively measured 1.2 cm, totally embedded.

MICROSCOPIC:

Fragmented material dominantly composed of septic granulation tissue and ulcerated mucosa with related capillary proliferation, edema and infiltration by neutrophils, lymphocytes and plasma cells. No evidence of malignancy in the this material.

DIAGNOSIS:

Rectal mass, endoscopic biopsy:

- Superficial material, active inflammatory ulceration and septic granulation tissue, possibly non-representative.
- Recommended for re-biopsy.

COMMENT:

In view of submitted data regarding the presence of mass lesion, please consider rebiopsy from the tumor mass proper away from the ulcerative area.
