Referred By:	د/ عبد الحكيم طه		Reported date:	2026-02-05	

PATHOLOGY REPORT

Clinical Information.	Breast mass
Nature of specimen.	Excision biopsy

GROSS:

Soft tissue fragments collectively measured 8.5x5.5x2.2 cm, the largest measuring 7x3 5x2.2 cm, having solid rubbery whitish cut section.

MICROSCOPIC:

A benign, well-encapsulated tumor formed of proliferating breast ducts and stromal fibrocytes. The architecture displays a mixed pattern, where areas of equal component representation (pericanalicular) alternate with areas where stromal proliferation compresses ducts into slit-like structures (intra canalicular). The stroma exhibits distinct ancient changes characterized by dense hyalinization and sclerosis, containing focal dystrophic microcalcifications. No evidence of malignancy is identified.

DIAGNOSIS:

Breast mass, Excision biopsy:

- **Ancient Fibroadenoma (Mixed type) with focal microcalcification.**
- **Negative for malignancy.**
