Pt. Age:	40 years.	Gender:	Male
Received date:		Reported date:	2026-02-05
Referred By:	د/ علي الزمزمي		

PATHOLOGY REPORT

Clinical Information.	Rough, lobulated, red lesion on the dorsal, lateral, and posterior surface of the tongue, extending anteriorly.
Nature of specimen.	Biopsy

GROSS:

Soft tissue fragments collectively measured 1.3x1x0.7 mm.

MICROSCOPIC:

Partially ulcerated mucosal fragments by nests, sheets, and syncytial clusters of malignant epithelial cells with indistinct cell borders, vesicular nuclei, prominent nucleoli, and moderate amounts of eosinophilic cytoplasm. Mitotic figures are readily identified. The tumor is intimately admixed with a dense lymphoplasmacytic infiltrate, imparting a lymphoepithelioma-like appearance.

DIAGNOSIS:

Tongue lesion, biopsy:

- Squamous cell carcinoma, lymphoepithelial type, grade 3.
