PATHOLOGY REPORT

Clinical Information.	Gastric and duodenal biopsies
Nature of specimen.	Endoscopic biopsy.

GROSS:

Two biopsies were received :

- 1- Gastric biopsy : soft tissue fragments collectively measured 0.3 cm, totally embedded.
- 2- Duodenal biopsy : soft tissue fragments collectively measured 1 cm, totally embedded.

MICROSCOPIC:

- 1- Gastric mucosa showing moderate infiltration by lymphocytes and plasma cells. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are present. Focal intestinal metaplasia is observed. There is no evidence of atypia or malignancy.
- 2- Duodenal mucosa shows broadening with focal flattening of villi indicating atrophy. Submucosa is moderately infiltrated by lymphocytes and plasma cells. No evidence of specific granulomas. No evidence of atypia or malignancy. Picture is consistent with celiac disease.

DIAGNOSIS:

Gastric endoscopic biopsies :

- H. pylori associated chronic active erosive gastritis with moderate inflammatory activity and focal intestinal metaplasia.

Duodenal endoscopic biopsies :

- Moderate chronic non-specific duodenitis.
- Negative for dysplasia and malignancy
